Product Description

Clementoni SlitherBot, experimental kit, from 8 years (DE edition).

A snake to assemble that comes to life and starts slithering through space as if it were real! A robot that moves through space for an unmatched play experience. The snake, an animal that has always fascinated people because of the fear it evokes, transforms into a robot that moves as if it were real. For the development of dexterity, logical skills and imagination. A robot inspired by the animal world that introduces children to robotics in a playful and intelligent way. The snake's sinuous movement, faithfully reproduced, amazes the child.

An exclusive and engaging experience that allows the child to interact with the assembled construction, making the game fun for children and adults alike.

A 40 cm long snake that makes interaction even more fun. After attaching the 12 upper components to the lower parts, simply switch on the robot to see it move. Now the adventure can begin. The motor has a special gear that moves the connecting rod once to the right and once to the left. In this way, the animal moves forward through smooth and realistic meandering.

Caution! Not suitable for children under 36 months!

- Recommended age: from 8 years
- Number of players: from 1 player
