shipping weight: 1.80 kg  
Manufacturer: Clementoni

### Product Description

Clementoni Mecha Dragon, experimental kit, from 8 years (DE edition).

A kit to create a fantastic mechanical dragon that interacts with the child and the environment with its 3 motors and multiple sensors to experience endless adventures together! The kite can be controlled via an app that communicates with radio frequency signals, or via the 4 infrared sensors. With its 2 motors and the servo motor, it moves its wings and mouth, as well as the drive wheel and the joint in the middle of its body, allowing it to turn and chase its prey as if it were alive. A unique robot with over 12 play modes to discover robotics in a simple and fun way and apply the principles of STEM (maths, computing, science and technology).

The mechanical dragon is perfect for developing dexterity, logic, spatial orientation and imagination, especially because of the great interactivity of the game and the unique experience of assembling it.

Caution. Not suitable for children under 36 months!

- Recommended age: from 8 years
- Number of players: from 1 player
